

Betta (includes male and female)

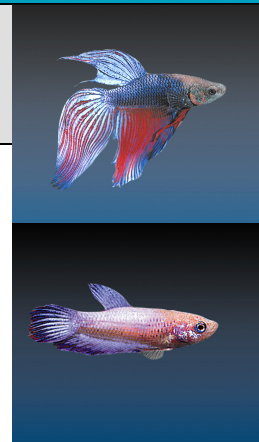

Betta splendens

CARE SHEET

Developed with and approved by a Qualified Veterinarian

Bettas are known for their jewel-bright colors and spectacular fins. They have been referred to as Siamese fighting fish due to the male betta's extreme aggressiveness toward other bettas. In their place of origin, Southeast Asia, bettas often live in small puddles, so they do well in smaller habitats.

Is a betta the right choice for your aquarium?

Yes	No
<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	<input type="checkbox"/>

Check "Yes" or "No" after reading the following statements:

- I have room for an appropriate size aquarium.
- The betta would be compatible with my other aquarium inhabitants.
- I can commit to providing proper care for this betta.
- A mature person will provide responsible and primary care for this fish.

If you answered, "Yes" to these statements, a betta may be the right choice for you! Continue reading about how to care for a betta and consult with a PETCO associate to learn more. PETCO is committed to responsible aquarium care.

Average Size 2½ inches long, not including tail

Life Span Up to 4 years with proper care

Diet Food may be flaked, tablet or frozen

Feed a variety of food to ensure complete nutrition

Feeding Feed sparingly 3 times per week and no more than fish can eat in three to five minutes; overfeeding can quickly foul the water, especially in smaller, unfiltered aquariums

Housing Bettas must be able to breathe from the surface of the water; they prefer water with little or no current due to their long fins.

Male bettas are usually kept individually in smaller containers or aquariums, but do best in containers of one liter (approximately one quarter of a gallon) or larger; as with all animals provide the largest habitat possible. Male bettas can live successfully in a community tank that does not have aggressive fish (such as tiger barbs) or fish that bettas may become aggressive toward (such as fancy guppies).

Female bettas may be housed with other community fish or other female bettas.

Bettas acclimate well to average household temperatures; be cautious of extreme temperature changes; aquarium should never be in direct sunlight or in a drafty area; water temperature should range from 74°F to 82°F.

Habitattitude™

Stable water quality, water temperature, and pH levels are critical to the health of fish. If you are unsure of your water quality or pH levels, PETCO provides free water testing.

Betta (includes male and female)

Betta splendens

CARE SHEET

Developed with and approved by a Qualified Veterinarian

Characteristics Bettas breathe from the water's surface with their labyrinth organ instead of through their gills. Will "flare" fins when threatened or disturbed

Males will attack another betta; males have also been known to attack similar-looking fish with flowing fins (for example angels, guppies, and swordtails).

Habitat Maintenance Check filter and other equipment daily (if used).
Check water quality and temperature at least once a week.

Do a complete water change for small bowls (less than 2 gallons) once or twice weekly; in larger aquariums, change 10–25% of the total volume of water every two to four weeks, or more often as needed.

Compatibility Male bettas must be kept in individual tanks or be the only betta in a community aquarium. Female bettas can be kept in a community tank.
Do not keep male and female bettas together.

- Signs of a Healthy Fish**
- Active and alert
 - Vibrant colors (males only)
 - Eats eagerly
 - Reacts aggressively to outside stimulus

Common Health Issues

Health Issue	Symptoms or Causes	Suggested Action
Fin Rot	Frayed or disintegrating fins; the base of the fins usually reddens.	Improve water quality; commercial antibiotics may be effective; consult with an aquatics specialist.
Ich	White spots appear on fins and body; fish rubs against hard objects or swims awkwardly.	Quarantine fish immediately; use commercial Ich remedy for at least two weeks; consult with an aquatics specialist.

- Signs of Illness**
- Loss of appetite
 - Labored breathing
 - Frayed fins
 - Spots or fungus on body or mouth
 - Listlessness
 - Staying at the bottom of the tank

If you notice any of these signs, test water quality and improve as necessary, or contact your exotic animal veterinarian or aquatics specialist.

Preventing Common Health Issues Avoid crowded conditions; they are a major cause of stress and disease.
Maintain good water quality with regular water changes and adequate filtration.
